Installation Section 1

To access the repo on your local, clone the following gitlab repository. OR in your desired directory, paste the following command. (Ensure you have Git installed).

```
git clone https://gitlab.computing.dcu.ie/floresj2/2025-csc1097-escobej2-floresj2.git
```

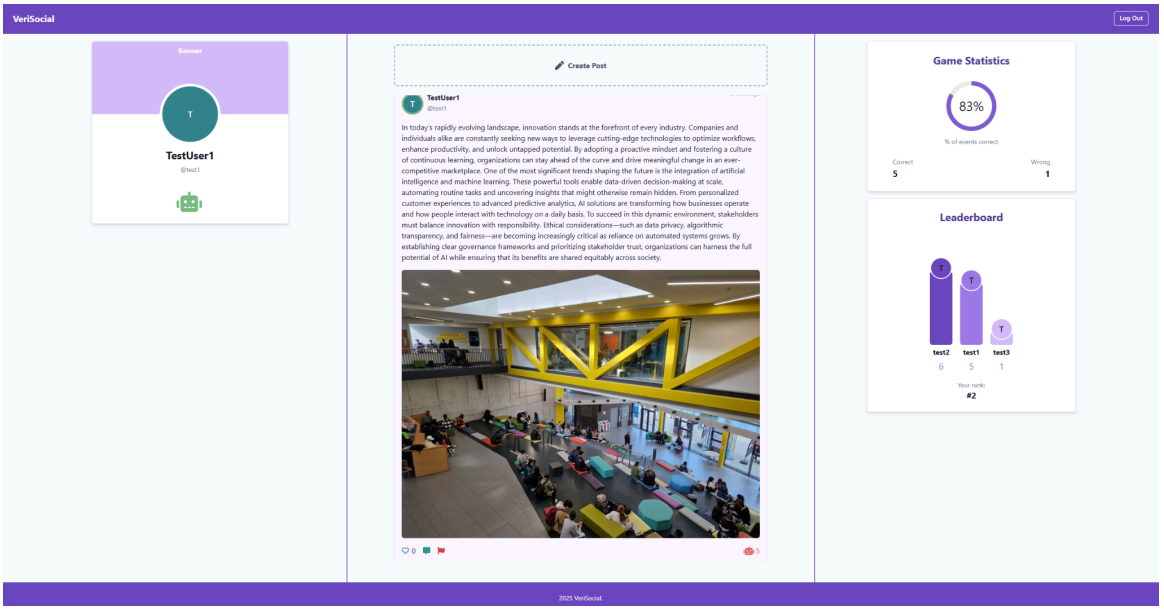

Frontend Installation (Development Environment) 1.1

In order to locally set up a DEV environment for the frontend client, the following steps must be followed. (Ensure you have node installed AND you are at the root folder).

```
cd 2025-csc1097-escobej2-floresj2/src/verisocial_fe
```

```
npm install
```

Once all files are downloaded after the npm install - run the script: npm run dev. The following localhost should start running. Click the link in the terminal OR head to http://localhost:5173/. If all steps are successfully completed the following screen / view should appear:

Running Tests Section 2

Frontend Testing 2.1

To run the frontend tests, you must have a terminal open and ensure that you are within the root directory of the frontend src files. To access the root directory of the frontend client, run the following command in the root directory of the repo.

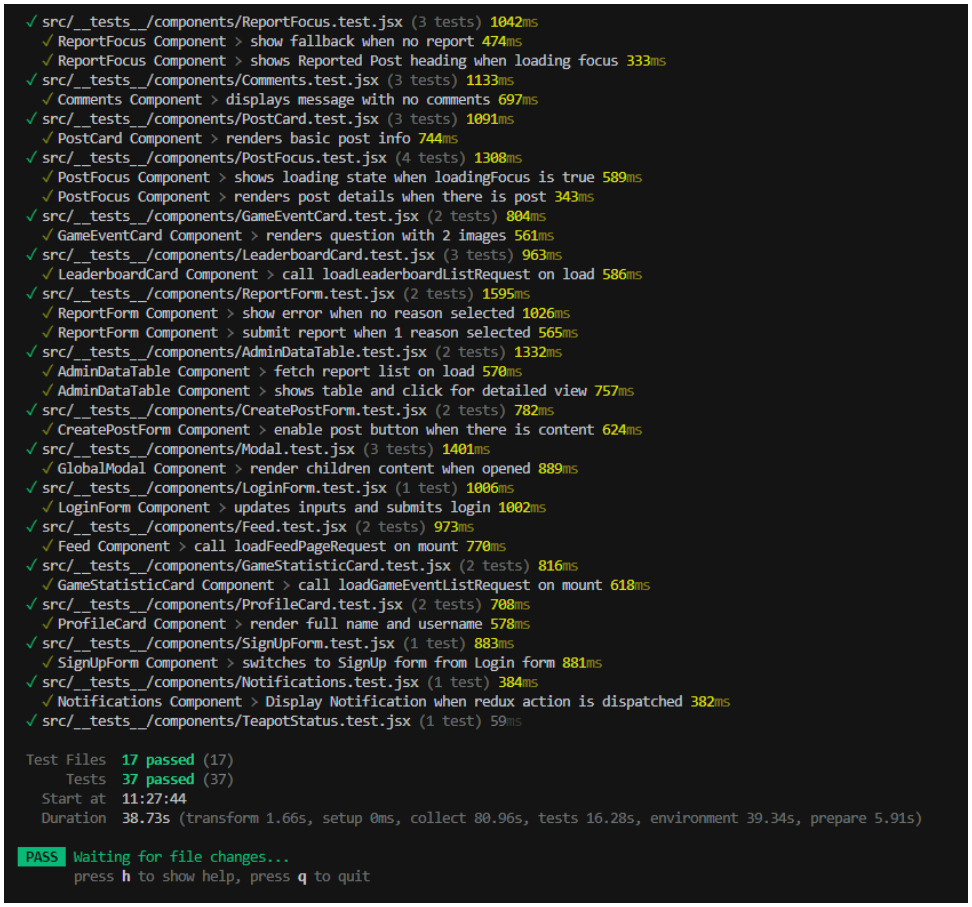

```
cd 2025-csc1097-escobej2-floresj2/src/verisocial_fe
```

To run the frontend unit tests, run the following script.

```
npm test
```

Once the script runs, a list of test files will be queued in your terminal display. After a while all scanned test files will complete successfully and after which you can press “q” to quit the terminal. (In the event tests fail, you can still press “q” to exit the testing view on the terminal.

All unit tests for the frontend are located in **../verisocial_fe/src/__tests__/components**. In this directory you will see test files in the form of COMPONENTNAME.test.jsx. All unit tests corresponding to a Component use the same name for the test file. E.g. **Component_A.jsx** will have unit tests named **Component_A.test.jsx** in the tests directory.

Linting allows us to automatically check for code errors, style, and inconsistencies. Its main use is to maintain code quality and enforce coding standards. To run the linting on the frontend code, the following script must be run in the root directory of the frontend folder. (../verisocial_fe/).

```
npm run lint
```

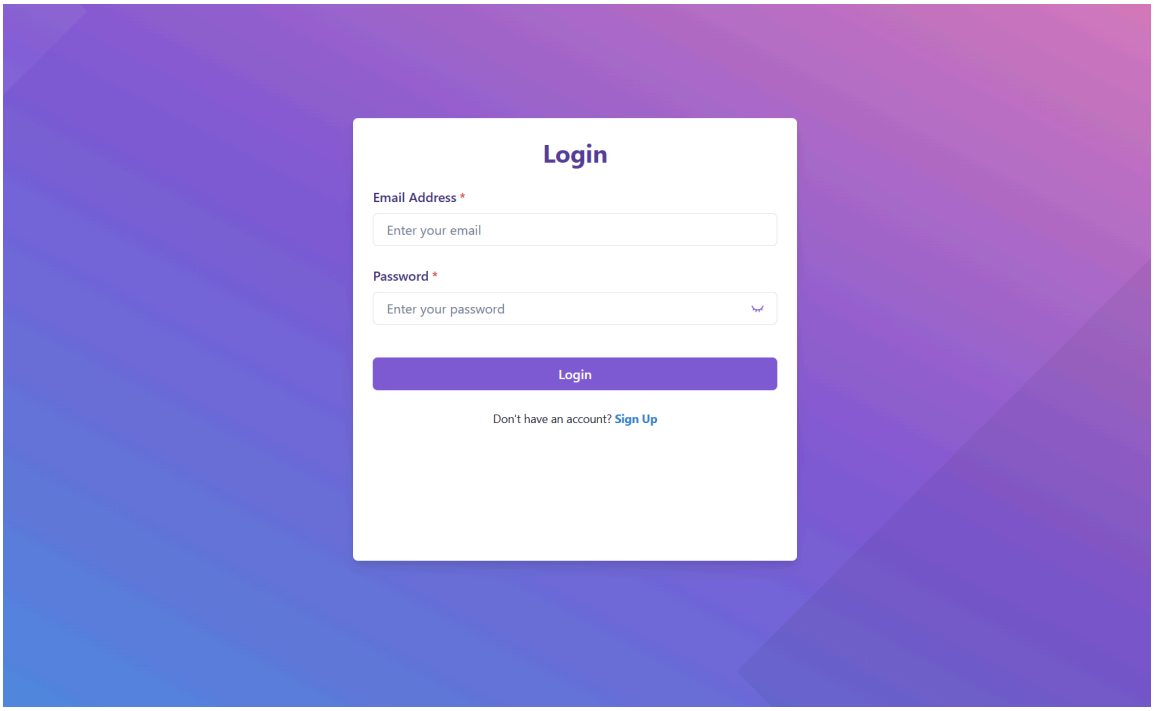

Once the script runs, it takes a moment to check all of the frontend code for any stylistic problems. The process should terminate by itself once no errors are found.

Backend Integration Testing 2.2

Application Features Section 3

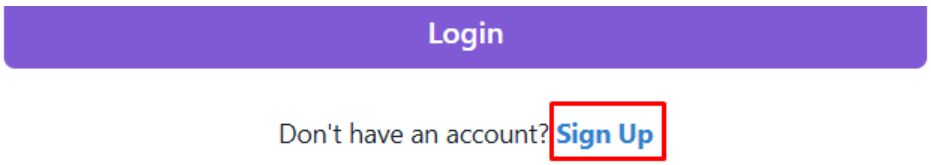

Login and Registration 3.1

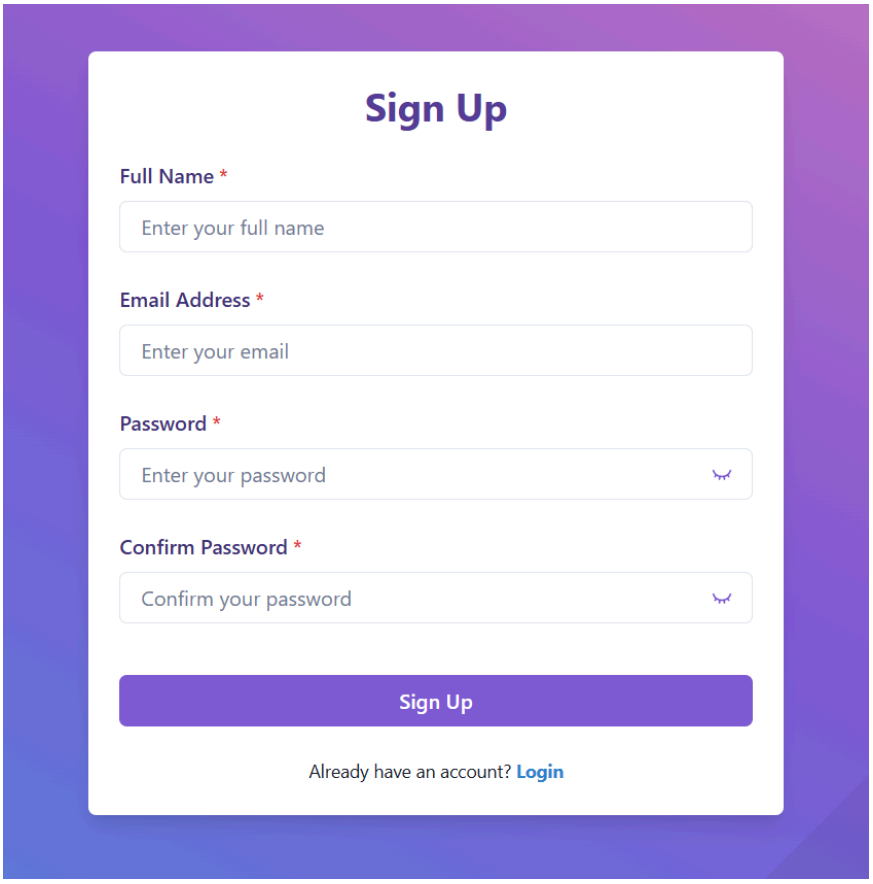

To access the Login and Registration screen simply click on the “Join Now” text to navigate to the Login form. Another option to access the login / registration screen is to go to the url: /login. If running the client locally this would be http://localhost:5173/login. On successful navigation the following screen should be visible.

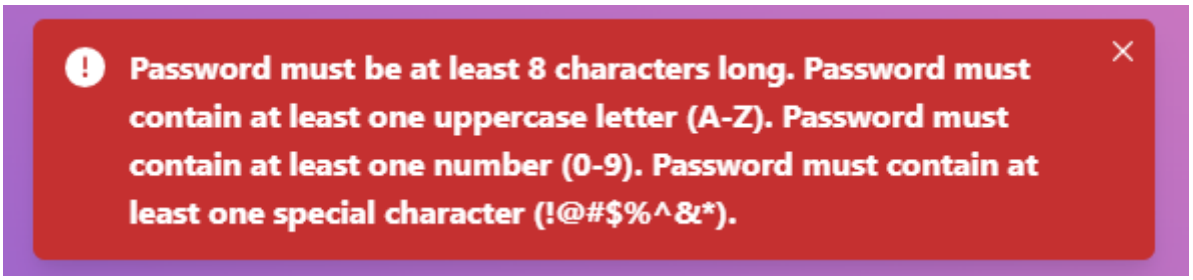

To login in to the site, you must enter your details on Login form. Details for login include, Email and Password. (More on this in the Registration Steps later). Once you have entered valid credentials, clicking the Login submit button will navigate you to the Home page screen. To logout of the application, you simply click on the LOGOUT button on the navigation bar at the top right corner of the screen. **NOTE:** A session lasts an hour so users will be automatically logged out once their authentication token expires.

To register to the site, you must first access the registration form. To navigate to this form, click on the "Sign up" text prompt below the login form.

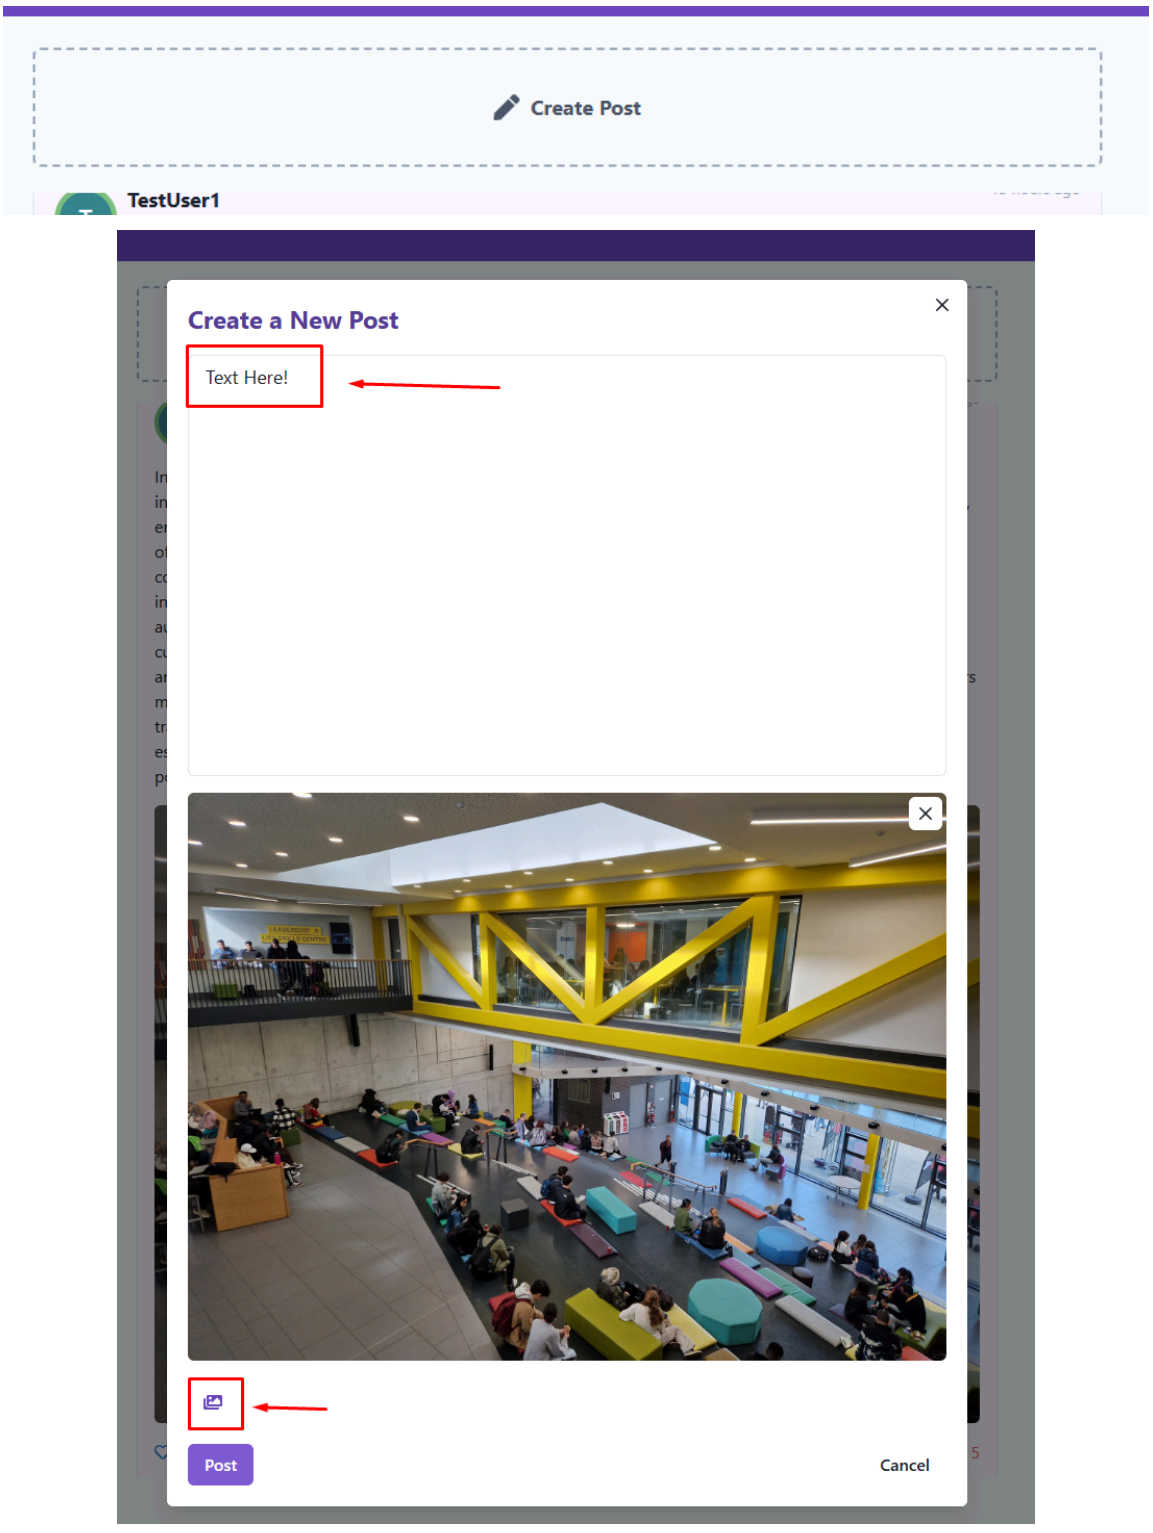

This will change the Login form screen to the Registration form screen. Here the user will be asked to enter account information such as Full name, Email address, and a Password. The Password must adhere to the following requirements before being able to successfully register. Confirm your password in the final input field once you have followed all the password requirements.

The user will be prompted upon successful registration and will be momentarily navigated back to the login form screen to allow users to log in to their newly created account.

Post Creation 3.2

To Create a Post, the user must navigate to the Home page. Here you will find a “Create Post” box. Clicking on this will prompt a pop up where you can input content such as Text and optionally Images. Note only one Image can be uploaded at a time.

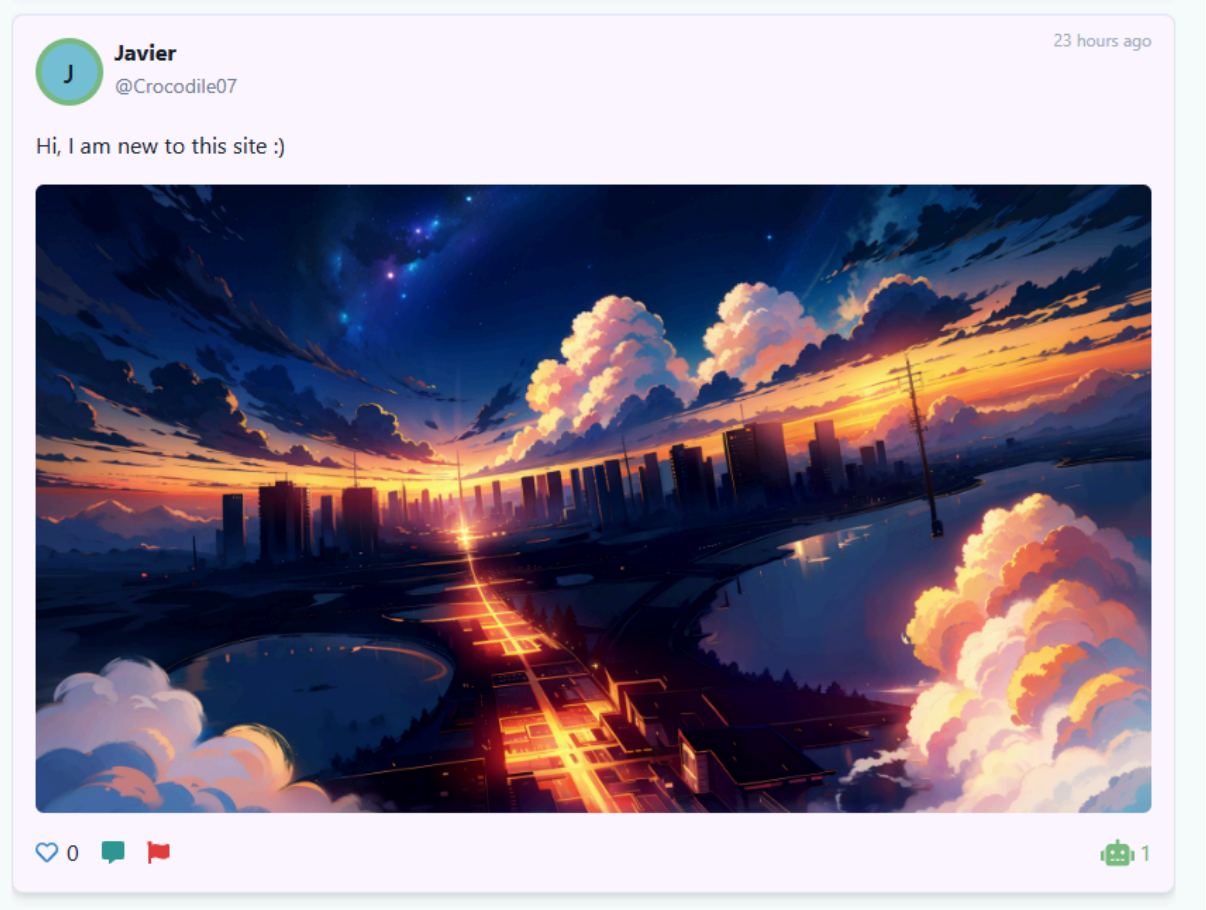

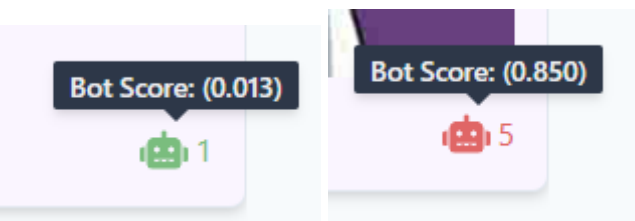

Once satisfied with your post - you can proceed to post the image. The Bot Score of a newly created post may take a few moments to update. Refreshing the page after waiting a moment should reveal the resulting bot score of the post.

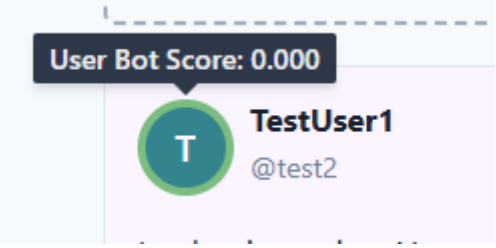

Post Card View (Timeline) 3.3

The Feed or “Timeline” in the middle of the Home Page screen is an “infinite scrolling” list of posts. Below is an example of your standard PostCard view in the feed. It contains a number of key points of interactions. The bottom-left row shows icons.

- The Heart Icon shows the number of likes for the post. It can also be clicked by the user to “Like” the post and increase its like count. It can be clicked again once liked to “de-like” the post or undo the like.
- Clicking on the Flag Icon will prompt the user to be able to report the post. (More on this below)
- Hovering over the Robot or “Bot” Icon will display the Posts bot score level. This is used to identify the likelihood of the post being AI-generated. The score is calculated between 0-1. The closer the score is to 1, e.g. 0.99 - the more it is likely to be AI-content. The 0-1 range is split into 5 levels. Level 1 is green and indicates not likely to be AI Content. While Level 5 is the max level and it indicates that the post is likely to be AI Content.
- Similarly hovering over the Avatar Icon / Circle of the Post will reveal the Poster’s bot score.

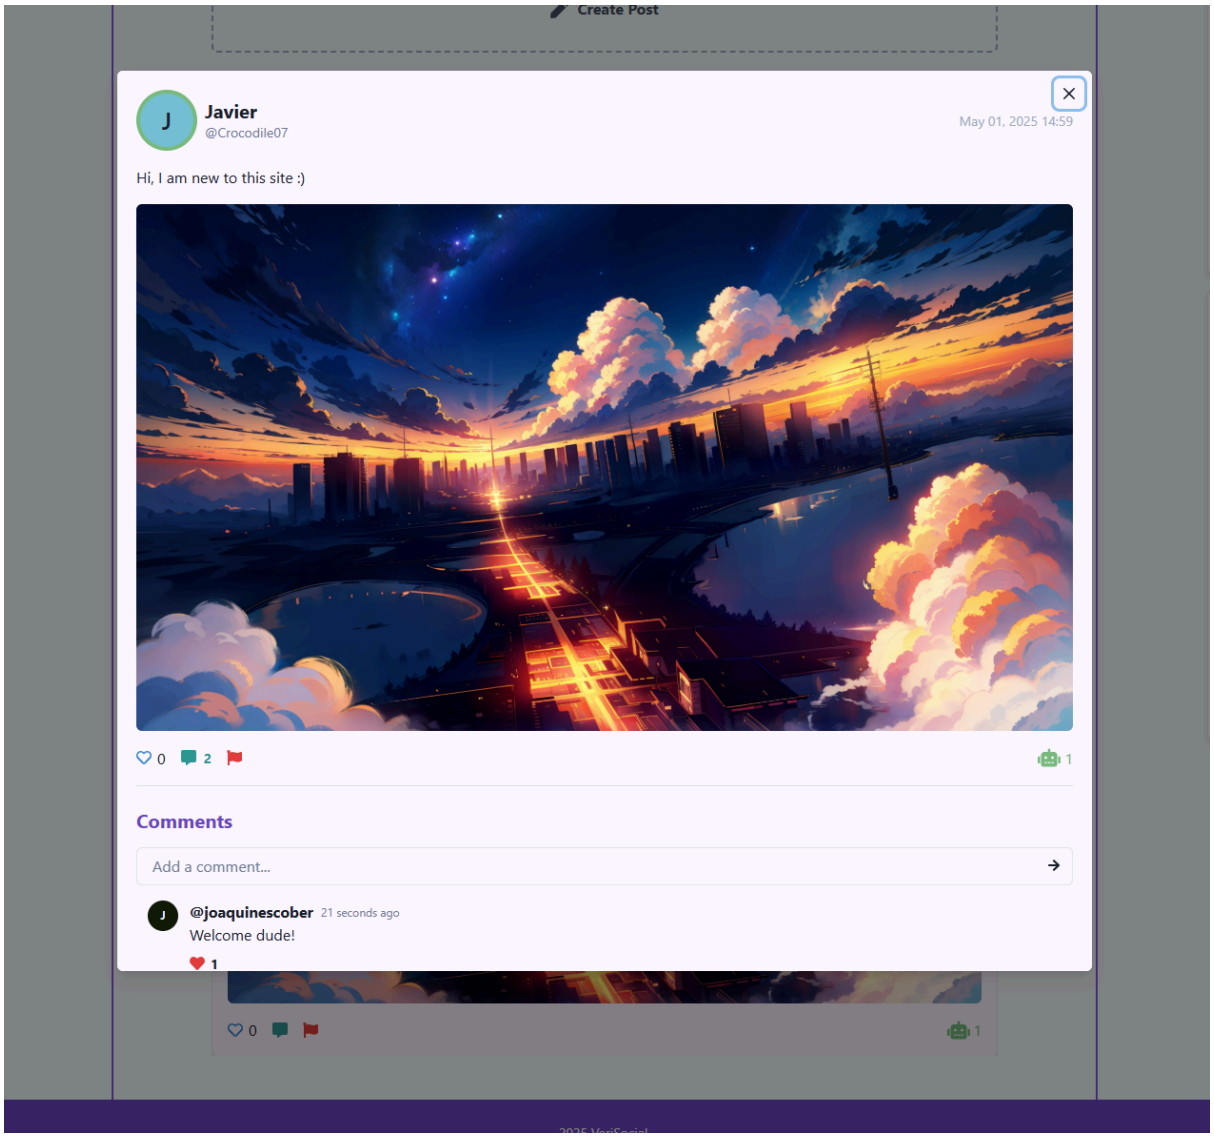

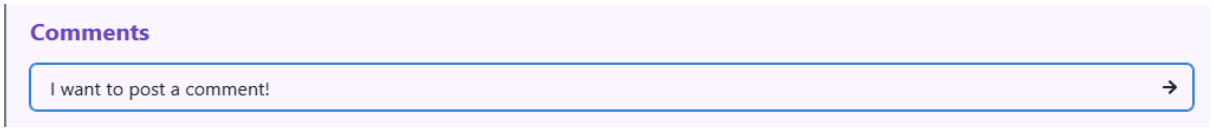

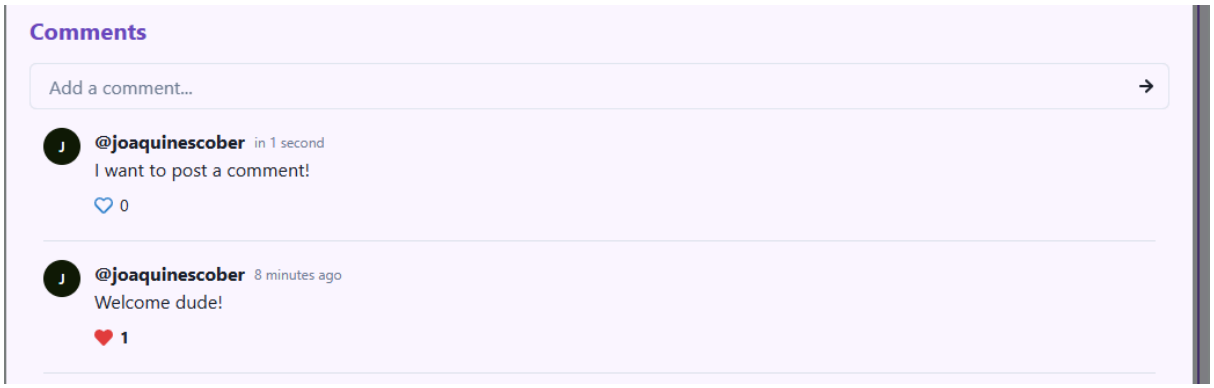

Post Focus View (Clicking on a PostCard) 3.4

Clicking on a Post will bring a popped-up focus view of the clicked post. The PostFocus view contains all the same details and interactions that the PostCard timeline view has, with the added ability to view and add comments. To view the comments simply scroll down the popped up post focus card. Comments can also be liked.

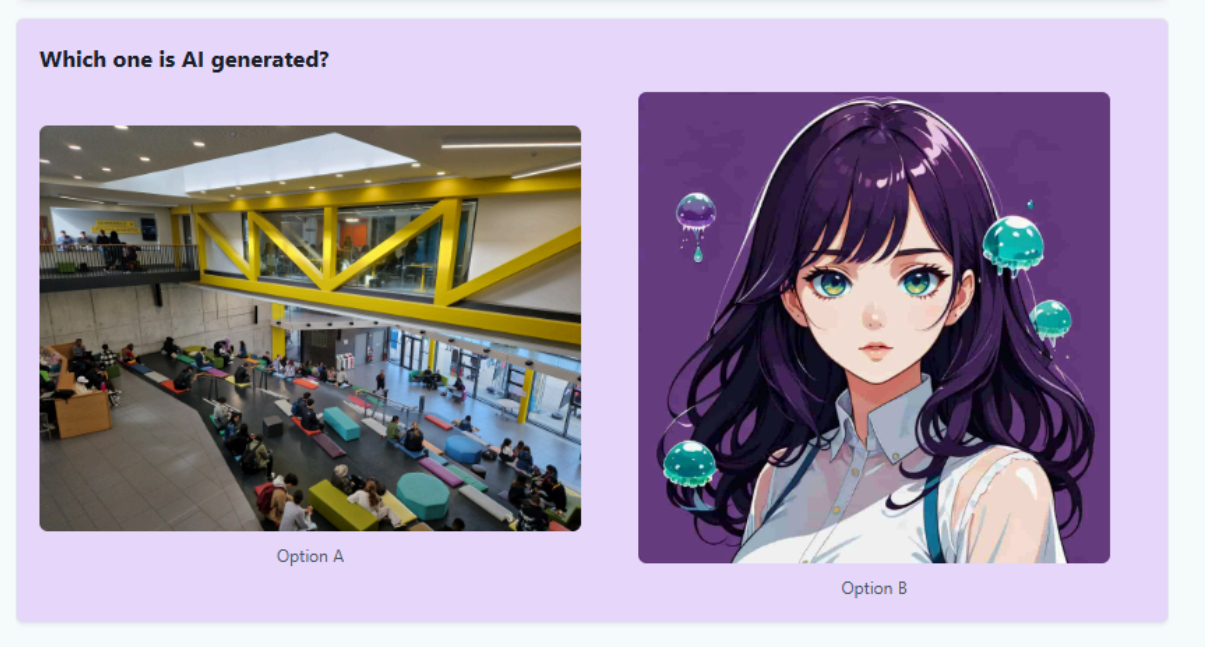

You can add a Comment via inputting text in the “Add a comment…” field. Submitting it will add it to the comment list below.

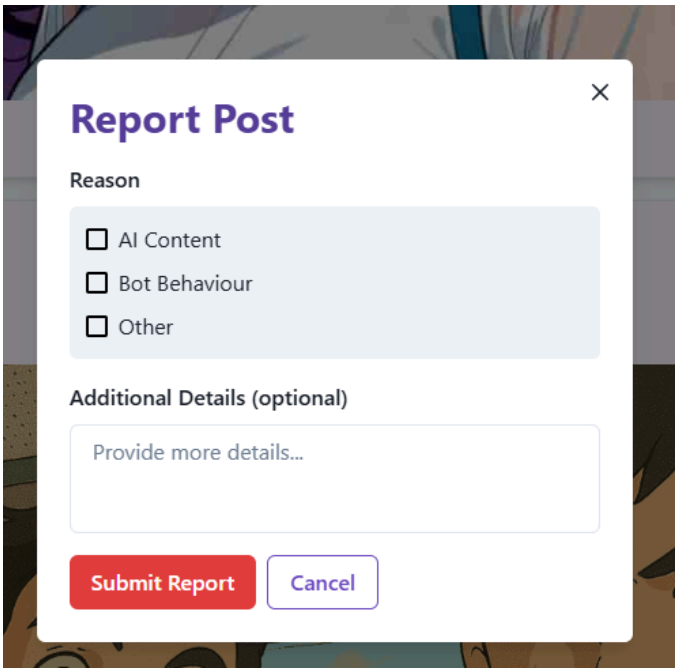

Game Events 3.5

Sometimes the user may encounter a “Game Event” whilst scrolling through the feed. The user can decide to participate in the Game Event should they wish. This event will prompt the user and ask which image is AI generated. Depending on the answer you can increase your account score - which is represented in the Game Statistics Card. Answering a question will remove the game event from your timeline regardless of it being correct or incorrect.

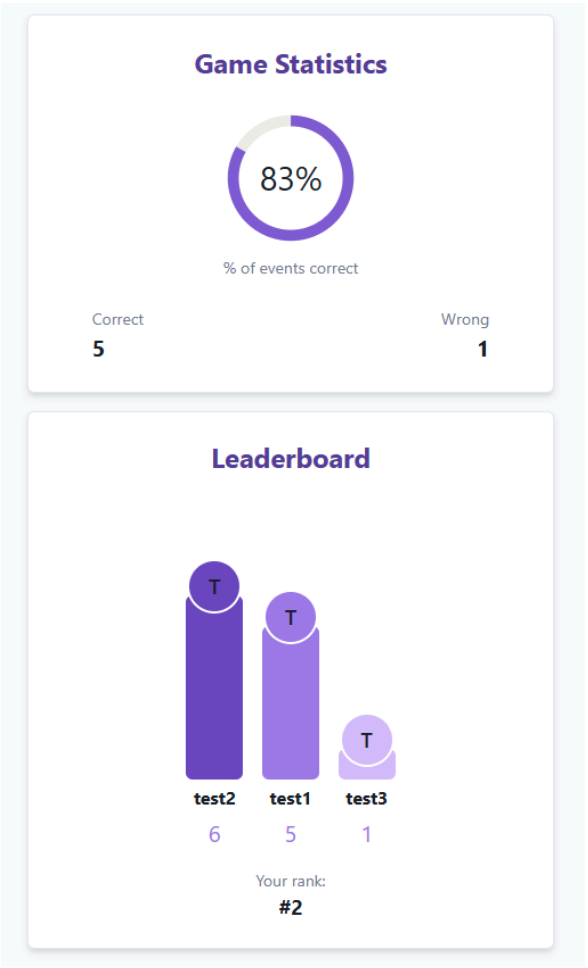

Reporting Posts 3.6

To report a Post, simply click on the Flag icon in either the PostCard view or the PostFocus view. To be able to submit a valid report, a user must select at least one of the following checkboxes. If the user selects the "Other" checkbox as one of the options, they are required to add input in the "Additional Details" Field.

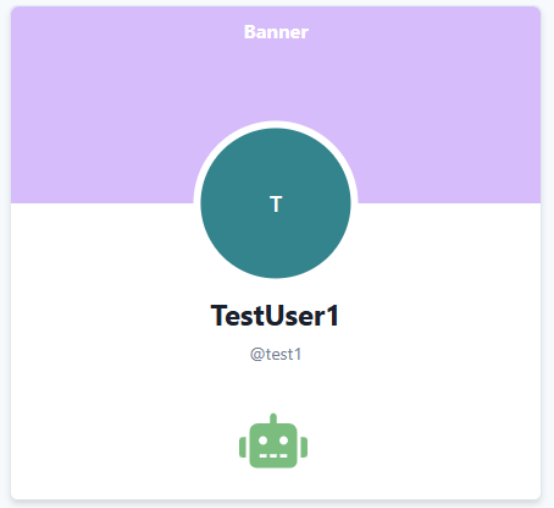

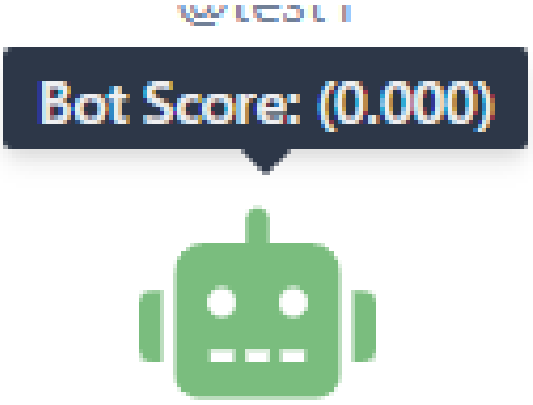

Display Cards 3.7

The Display Cards located at the right hand side of the Home Page screen show statistics for the logged in user as well as global user base statistics. The Game Statistics Card showcases the percentage of correctly answered events. It also displays the number of events you answered correctly and the number of events you answered incorrectly. The Leadboard Card showcases the Top 3 users who have the most game events answered correctly along with the number of events they got correct. Your current rank across all users in the database will be shown at the bottom of the card.

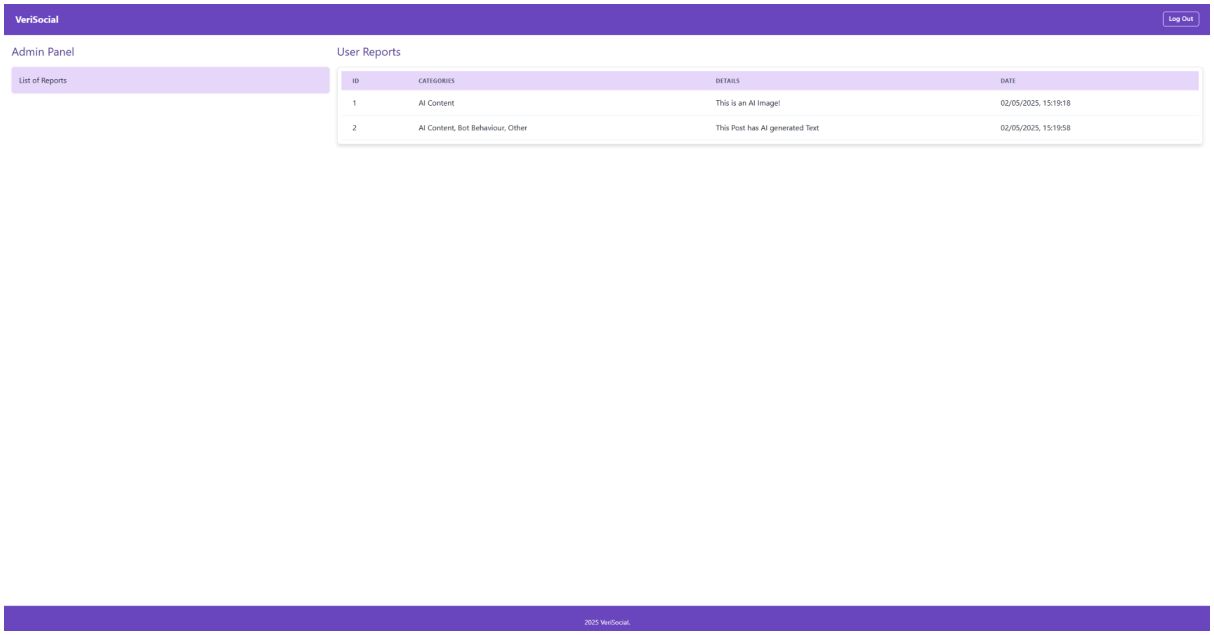

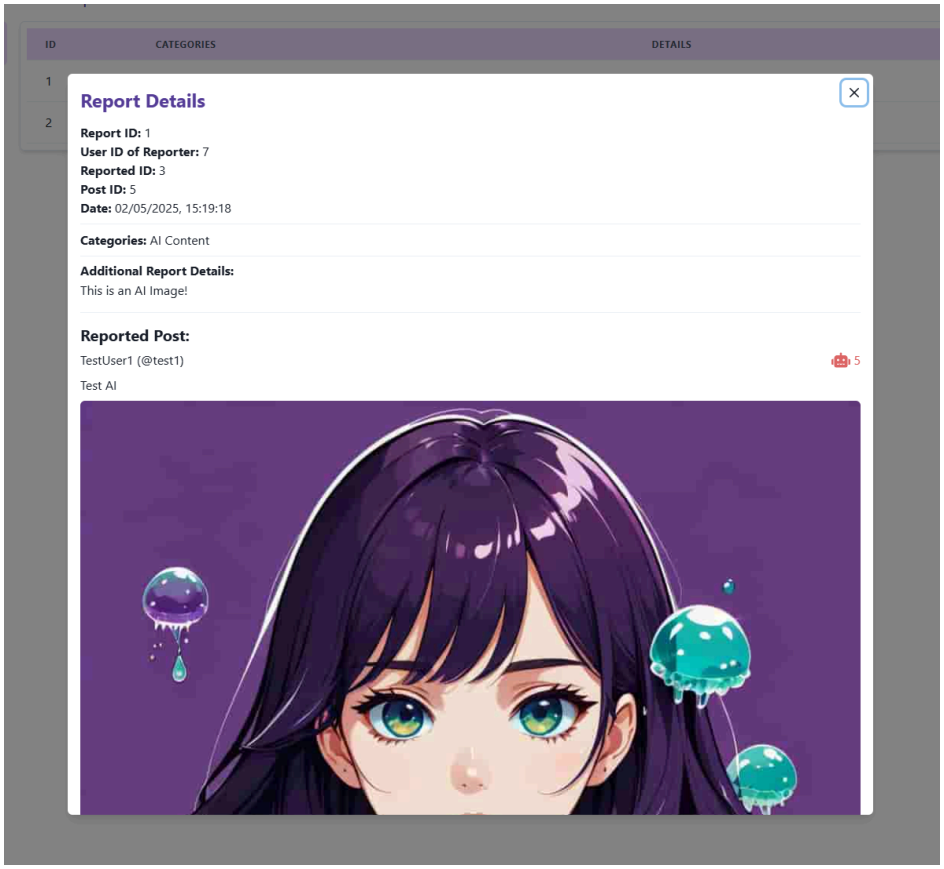

On the right hand side of the screen you will see a simple Profile Card display. It shows the current logged in user's details, including fullname, username @ handle and their current account bot score. You can see the exact bot score of your account by hovering over the bot icon.

To Access the admin page, navigate to the url http://localhost:5173/admin. The Admin page view shows a Datatable for all submitted posts. In the Datatable you can see high-level details of the report, including report ID, Categories of the report, Additional Details (if any) and the Date of the report submitted. Clicking on the report will show a focus view of that report. Here you can see the same details but more indepthly. It also shows the reported post's details
